

**Infopower** rated the Trade Show at the GMA 2007 Conference a great success with many delegates visiting the stand in a short space of time. While this made it difficult to spend much time with the many interested delegates it was good to have the opportunity to raise awareness of our company and Golf Club specific computer systems and several positive leads were generated as a result.

Infopower used this occasion to launch its new **Mobile POS system** designed for use on Golf Drink Carts, Halfway Houses or other temporary locations or places where direct network connections are not possible or practical. The Mobile POS (pictured here) is based on a Pioneer Micro PC (measuring only 228 x 146 x 25mm) running Windows XP and comes with Infopower's Touch POS software pre-installed.

The Mobile POS is used to record all sales just like a normal touch screen Point of Sale till but in mobile situations. Following the completion of trading for the day using this device it is returned to the Club House and then connected to the Club's main computer network. The sales transactions are then uploaded to Infopower's Infotel system, updating the main Stock Control system, Cashiering and Member's House Accounts where sales were charged by the Members on-course. The General Ledger system is also automatically updated with the sales information.

Use of this Mobile POS will result in great savings in staff time by not having to re-enter the sales information back into the Club's main system at the end of the day. Where Member charging is allowed this could account for more than an hour per day, not to mention the greater accuracy of these sales and charges over relying on hand written dockets.

Infopower received their first order for the Mobile POS the day after it was released at the GMA Trade Show. The order is from an existing client who expects that in staff savings alone they will recover the investment in this device within only a few months.
